

ASSET MANAGEMENT—TRACKING

The function of pallet and container management has been slowly changing over the past few years. Many companies have now realized that these are not just expendable shipping platforms but are an integral part of the supply chain. What was once a necessary expense is now an **Asset** and is contributing to the bottom line through improved throughput and better margins.

The VPs of these organizations are now being asked by other departments such as Sales, Marketing and Finance, for data that will help run their departments more efficiently. The challenge is to figure out how to extend this data and to share it with each department.

PALNET offers an online data management solution to help track all of your Asset Management needs. This tool provides access to your financial and activity based transactions anywhere they occur. It is a real time system so the data is being constantly updated throughout the day. And, since this is a Web based system you will have access anytime of the day or week.

With PALNET's **Asset Management—Tracking** system you can rest assured that information is reliable and accurate. You can view static reports or build ad-hock reports customized to the look and feel you desire. This data is easily downloadable so that you can incorporate it into your own reporting tools as well. Some of the free benefits of this system are:

- **Easy access to account data**
- **Security is defined by you**
- **Store and review valuable Key Performance Indicators**
- **Measure performance between facilities to identify best practices**
- **Complete transactional history**
- **Asset movement and traffic flow data**
- **Static and ad-hock reporting capability**
- **Utilizes electronic data interchange**
- **Greatly reduces the risk of missed or inaccurate transfers**
- **Reduce Asset Management cost**
